

ROOSTER C2

COMMAND & CONTROL · AI-ENABLED SIMULATION

SCAN FOR DEMO

Train **10x more operators**—without 10x more simulators.

MISSION VALUE STATEMENT

Rooster delivers portable, voice-driven C2 simulation that multiplies training repetitions without consuming enterprise simulator time.

Units arrive at high-fidelity events prepared, instructors focus on advanced instruction, and organizations increase throughput at a fraction of cost — without altering existing programs of record.

REALISTIC TRAINING SCENARIOS

OPERATOR TRAINING ENVIRONMENT

Realistic C2 reps where operators already are.

AI-ENABLED DECISION PIPELINE

Voice-driven interaction with structured intent, scoring, and feedback.

ASSESSMENT & DEBRIEF

Every rep produces measurable readiness data.

WHY ROOSTER — PROCUREMENT-RELEVANT DIFFERENTIATORS

SUPPLEMENTS, NOT REPLACES

Extends existing simulator capacity by offloading foundational reps; maximizes ROI on programs of record.

DOCTRINE-ALIGNED

Voice procedure and engagement logic modeled to U.S. C2 standards; tailorable per command.

PORTABLE FOOTPRINT

Runs on standard government laptops; no facility build-out, no dedicated support team per rep.

MODEL-AGNOSTIC

Pipeline supports on-prem, air-gapped, or government-approved models per DoD security constraints.

COST PER REP

Far below enterprise simulator hourly cost; scales linearly with seats, not facilities.

PILOT-READY

Operational prototype available now; deployable pilot kit requires no integration or infrastructure.

CORE CAPABILITIES

- Voice-driven scenario interaction
- Customizable scenarios & threat sets
- Synthetic track injection
- Doctrine-voice procedure enforcement
- Browser-based and laptop-deployable
- Real-time speech transcription
- Intent recognition & call-sign parsing
- Automated scoring against doctrine
- Automated clarification & error recovery
- Auto-generated debrief artifacts
- Per-trainee proficiency tracking
- Instructor-in-the-loop overrides

TARGET CUSTOMERS

- U.S. Air Force schoolhouses & FTUs
- U.S. Army ADA & Fires training
- U.S. Navy / USMC C2 training cadres
- Units spinning up for deployment
- State Partnership Program (SPP)
- Joint & combatant command training cells
- Defense training prime contractors
- Allied / NATO partner training organizations

READINESS

Supports unit RAP, qualification & continuation training.

DEPLOYMENT

Self-contained · Integrated · Browser

SECURITY POSTURE

UNCLAS for partners · CLAS for US & allies

SUGGESTED NAICS

PORTABLE · VOICE-DRIVEN · OPERATOR-READY

More Reps. Lower Cost. Better Operators.

Rooster C2 Venture Snapshot

Page 2 | Problem, opportunity, and market gap

OPPORTUNITY: FILL THE MISSING MEDIUM-FIDELITY TRAINING LAYER

Train 10x more operators - without 10x more simulators.

Rooster converts scarce, expensive simulator time into earlier, higher-volume practice before high-fidelity events.

Preserved from NEXUS pitch slide 4: training tools cluster at low fidelity and high fidelity; medium fidelity is the missing layer.

PROBLEM

Enterprise simulators are powerful but scarce. Basic repetitions often occur too late, causing underprepared trainees, instructor time lost to fundamentals, and constrained training throughput.

ROOSTER WEDGE

Rooster is a portable, voice-driven C2 simulator for basic and intermediate reps that complements - not replaces - enterprise systems and major events.

INITIAL BEACHHEAD

Start with U.S. military schoolhouses, FTUs, training squadrons, and units spinning up for deployment; expand to joint, partner-nation, and defense-training markets.

MARKET LOGIC

- Low-fidelity tools: table-top, white-board, chair-flying, discussion - cheap but limited feedback and realism.
- Medium-fidelity gap: credible controller-proficiency reps with voice interaction, scoring, and debrief.
- High-fidelity tools: enterprise sims, virtual/local live-fly, flag-level exercises, combat ops - powerful but constrained by cost, slots, and support teams.

Rooster C2 Venture Snapshot

Page 3 | Starting point and baseline traction

STARTING POINT SNAPSHOT

From prototype and pitch traction to disciplined venture experiments.

Rooster begins the challenge with working software, a clear customer pain point, and active market discovery. The next stage is to quantify training value, reduce adoption risk, and package the first pilot-ready kit.

PRODUCT BASELINE

- Working airgapped AI-enabled Air Force and ARMY multiple scenario prototype (FLAGSHIP)
- Voice-driven interaction
- Scenario and entity response logic
- Automated scoring/debrief concept
- Playable ARMY Air Defense Artillery web demo simulator
- Public Rooster C2 demo site

VENTURE BASELINE

- Rooster C2 LLC formed
- UMGC NEXUS Technology Track First Prize
- 5+ follow-on CEO/portfolio-manager meetings
- Product slicksheet and pitch materials
- Active exploration of SBIR, SAM.gov, pilots, and partner pathways

EXECUTION BASELINE

- Founder-market fit as C2 operator
- Unclassified-first product framing
- Model-agnostic / LLM-capable architecture
- Ethics/legal coordination path
- Pilot-kit packaging as next milestone

CURRENT READINESS PATH

BASELINE EVIDENCE TO LOG ON DAY 1

- Demo artifacts: product walkthrough video, ARMY Air Defense Artillery web demo simulator, screenshots, and page-1 slicksheet.
- Stakeholder map: C2 instructors, schoolhouse leaders, C2 units, industry partners, SMEs, support agencies, and defense-training primes.
- Initial hypotheses: Rooster increases reps, returns instructor time, reduces pre-sim readiness gaps, and produces useful debrief data.
- Current constraint: product is software-prototype stage; field-designed kit and measurable training-outcome evidence are the next critical milestones.
- Responsible commercialization: unclassified-first, privately developed, and structured subject to applicable ethics/legal guidance.

Rooster C2 Venture Snapshot

Page 4 | Highest-risk assumptions

FIVE HIGHEST-RISK ASSUMPTIONS

The venture succeeds only if these assumptions are tested with evidence, not confidence. The experimentation plan converts each assumption into data that can drive a clear decision: proceed, pivot, narrow scope, or pause.

RISK ASSUMPTION	WHAT MUST BE TRUE	EVIDENCE TO GATHER	DECISION THRESHOLD
1. Training effectiveness	Rooster reps improve procedure accuracy, speed, decision quality, and readiness before high-fidelity simulator events.	Pre/post scenario scores; error trends; time-to-decision; instructor-rated performance; student confidence and workload.	Evidence supports measurable improvement across repeated reps and clear value before expensive sim events.
2. Buyer / adopter pull	Schoolhouses, FTUs, units, or defense partners will sponsor a pilot and commit time, users, and feedback.	20-30 interviews; demo scorecards; letters of interest; pilot sponsor criteria; budget or contracting owner identified.	At least one credible pilot path and multiple target customers rate the pain and solution as high-priority.
3. Deployment and security	A low-friction UNCLASSIFIED-first pilot can run on laptop/edge/browser configurations with a path to controlled environments.	Setup time; hardware requirements; network assumptions; user-run pilot-kit test; security stakeholder feedback.	Non-founder can operate a pilot scenario using written guide and approved configuration assumptions.
4. Assessment trust	Instructors and SMEs trust AI-enabled scoring, debriefs, and error categorization enough to use them in training decisions.	SME comparison of AI debriefs; rubric alignment; false-positive/false-negative review; explainability notes.	SMEs agree scoring is useful for formative training and identify manageable changes for pilot use.
5. Procurement / scaling path	The fastest route is viable through SBIR/STTR, OTA/pilot, SAM.gov opportunities, prime/sub partnerships, or unit innovation funds.	Pathway comparison; partner interviews; fit to solicitation language; procurement owner; estimated timeline and deal structure.	One primary path and one backup path produce actionable next steps within the competition window.

EXPERIMENTATION ROADMAP

Rooster's biggest unknowns will be converted into distributions, risk responses, and decisions. Each experiment produces data for the official experiment log: hypothesis, design, AI used, evidence collected, decision made, and impact on venture direction.

01

CUSTOMER DISCOVERY

20-30 INTERVIEWS

- Interview C2 instructors, schoolhouse leaders, C2 units, industry partners, SMEs, and support agencies.
- Measure pain intensity, current prep methods, pilot willingness, budget owner, and deployment constraints.

02

DELPHI RISK PANEL

QUANTIFY ASSUMPTIONS

- Empanel relevant C2-unit stakeholders, industry partners, SMEs, and support agencies.
- Brief Rooster status and roadmap; show a full mission walkthrough; anonymously elicit min / most likely / max estimates.

03

MONTE CARLO RISK MODEL

TRAP / TRANSFER / MITIGATE / ACCEPT

- Use Delphi PERT inputs to model uncertainty around the five risk assumptions.
- Estimate probability of pilot viability, expected rep increase, instructor-time return, setup burden, and assessment trust.

04

STUDENT TRIAL AT TRL 4-5

10-USER SOFTWARE TEST

- Use AI instrumentation as 10 students run the software simulator.
- Capture reps completed, errors, response time, decision accuracy, clarification count, debrief score, and learning curve.

05

FIELD KIT + PROCUREMENT TEST

PILOT-READY DECISION

- Run distribution analysis and a second Monte Carlo model using observed student data.
- Use results to design the first hardware/software field prototype, then test kit packaging and procurement pathway.

PLANNED USE OF AI TO ACCELERATE LEARNING

AI-instrumented simulator pipeline converts thousands of console-log lines into structured, decision-ready datasets — feeding distribution-fit estimation, Monte Carlo risk simulations, regression-based performance predictors, and forward-looking readiness forecasts. Augmented by interview coding and theme extraction, scenario generation, AI-assisted debrief and scoring, experiment-log drafting, and rapid pilot-kit documentation.
